

## 2. Explore Prisma Client

### Goal

The goal of this lesson is get comfortable with the Prisma C available database queries you can send with it. You'll learn (like nested writes), filtering and pagination. Along the way, introduce a second model with a relation to the `User` mode

### Setup

You can continue working in the same `prisma-workshop` p  
`script.ts` file contains a `main` function that is invoked ea

### Hints

#### ▼ *Type yourself, don't copy and paste*

To learn and really *understand* what you are doing for ea  
**paste the solution** but type out the solution yourself (ev

#### ▼ Autocompletion

Prisma Client provides a number of queries that you can. You can learn about these queries in the [documentation](#) using *autocompletion*.

To invoke the autocompletion, you can open `src/index` `main` function (you can delete the comment `// ... y` `go here` that's currently there):

```
import { PrismaClient } from '@prisma/client'
ent() async function main() { const result =
on will show up if you type this } main() .c
.finally(async () => await prisma.$disconnect
```

▼ Expand for a screenshot of the autocompletion

```
import { PrismaClient } from '@prisma/client'

const prisma = new PrismaClient()

async function main() {
  const result = await prisma.
  main()
  .catch((e) => console.error(e))
  .finally(async () => await prisma.$disconnect())
}
```

- connect
- disconnect
- executeRaw
- on
- post
- profile
- queryRaw
- user

Once you typed the line `const result = await prisma.` be shown that lets you select the options for composing want to query or using another top-level function like `$`. Autocompletion is available for the *entire* query, including to provide!

## ▼ Prisma Studio

Prisma Studio is a GUI for your database that you can use. You can start Prisma Studio by running the following command:

```
npx prisma studio
```

## Tasks

At the end of each task, you can run the script using the following command:

```
npm run dev
```

### Task 1: Write a query to return *all* **User** records

To warm yourself up a bit, go and write a query to return *all* **User** records. Print the result to the console using `console.log`.

#### ▼ Solution

```
import { PrismaClient } from '@prisma/client'
const prisma = new PrismaClient()
async function main() {
  const result = await prisma.user.findMany()
  console.log(result)
}
main().catch((e) => console.error(e)).finally(() => prisma.$disconnect())
```

### Task 2: Write a query to create a new **User** record

In this task you'll create another **User** record. In your Prisma Client, write a query to create a new **User** record for `email` but *not* for `name`:

- `email`: "alice@prisma.io"

Can you find the query that lets you do that?

## ▼ Solution

```
import { PrismaClient } from '@prisma/client'
const prisma = new PrismaClient()
async function main() {
  const result = await prisma.user.create({
    data: { email: "alice@prisma.io" } })
  console.log(result)
}
main().catch(console.error).finally(async () => await prisma.$disconnect)
```

**Task 3: Write a query to update an existing `User` record**

In this task, you will update the `User` record you just created with the following data:

- `name`: "Alice"

How can you update an existing database record with Prisma Client?

## ▼ Solution

```
import { PrismaClient } from '@prisma/client'
const prisma = new PrismaClient()
async function main() {
  const result = await prisma.user.update({
    where: { email: "alice@prisma.io" },
    data: { name: "Alice" } })
  console.log(result)
}
main().catch(console.error).finally(async () => await prisma.$disconnect)
```

**Task 4: Add a `Post` table to your database**

To explore more interesting Prisma Client queries, let's expand our database schema by adding a new model and configure a relation between the existing and the new model.

The new `Post` model should be shaped as follows:

- `id`: an auto-incrementing integer to uniquely identify each post
- `title`: the title of a post; this field should be *required* in the database
- `content`: the content/body of the post; this field should be *optional* in the database
- `published`: indicates whether a post is published or not; by default any post that is created should *not* be published

- `author` and `authorId` : configures a *relation* from a `Post` to a `User`. `author` is considered the author of the post; the relation should be one-to-one; `authorId` does not necessarily need an author in the database; note that `authorId` is optional, meaning you'll need to add the second side of the relation to the `User` model as well

► Solution

Once you have adjusted the Prisma schema and your two models, you can apply the changes against your database:

```
npx prisma migrate dev --name add-post
```

## Task 5: Write a query to create a new `Post` record

In this task, you'll create a first `Post` record with the title "Hello World"

▼ Solution

```
import { PrismaClient } from '@prisma/client'
const prisma = new PrismaClient()
async function main() {
  const result = await prisma.post.create({
    data: { title: "Hello World" }
  })
  console.log(result)
}
main().catch(console.error).finally(async () => await prisma.$disconnect())
```

## Task 6: Write a query to connect `User` and `Post` records

You now have several `User` records and exactly one `Post` record. You want to connect the `Post` record to a `User` record via the `authorId` foreign key column in the `Post` model.

When using Prisma Client, you don't need to manually set foreign key relations using Prisma Client's type-safe API. Can you figure out how to create a `Post` record and **connect** it to an existing `User` record via the `connect` method?

Use the editor's autocompletion to find out about the query methods available for the `Post` model.

## ▼ Solution

```
import { PrismaClient } from "@prisma/client";
async function main() {
  const result = await prisma.user.findMany({
    where: { id: 1 },
    data: { author: { connect: {} } },
  });
  console.log(result);
}
main().catch((e) => console.error(e)).finally(async () => await prisma.$disconnect());
```

**Task 7: Write a query to retrieve a single `User` record**

In task 1, you learned how to fetch a list of records from the database. Now, let's learn how to retrieve a single `User` record with a Prisma Client query by using the `findUnique` method.

## ▼ Solution

```
import { PrismaClient } from "@prisma/client";
async function main() {
  const result = await prisma.user.findUnique({
    where: { email: "alice@prisma.io" },
  });
  console.log(result);
}
main().catch((e) => console.error(e)).finally(async () => await prisma.$disconnect());
```

Note that you can use any *unique* field of a Prisma model as the `where` argument, so in this case you could identify a `User` record by its `email` field.

**Task 8: Write a query that selects only a subset of fields**

For this task, you can reuse the same `findMany` query from task 1. However, this time your goal is to only select a subset of the fields returned. Specifically, all returned objects should only contain the `id` field.

## ▼ Solution

```
import { PrismaClient } from "@prisma/client";
async function main() {
  const result = await prisma.user.findMany({
    select: { id: true },
  });
  console.log(result);
}
main().catch((e) => console.error(e)).finally(async () => await prisma.$disconnect());
```

## Task 9: Write a nested query to *include* a relation

You'll now start exploring more relation queries of Prisma Client where you *include* a relation, concretely: Take your query from the **Post** table in the result.

### ▼ Solution

```
import { PrismaClient } from "@prisma/client";
async function main() {
  const result = await prisma.user.findMany({
    where: { email: "alice@prisma.io" },
    include: { posts: true },
  });
  console.log(result);
}
main().catch(e => console.error(e)).finally(async () => await prisma.$disconnect());
```

Notice that the **result** of your query is fully typed! by Prisma Client, here's what it looks like:

```
const result: (User & { posts: Post[]; })[] | null;
// and `User` types look as follows:
type Post = {
  id: string;
  content: string | null;
  published: boolean;
  author: User | null;
};
type User = {
  id: string;
  name: string;
  email: string;
};
```

## Task 10: Write a nested write query to create a new **Post** record

In this task, you'll create a new **User** along with a new **Post** (nested write) query. You can again use the autocompletion the documentation here.

### ▼ Solution

```
import { PrismaClient } from "@prisma/client";
async function main() {
  const result = await prisma.user.create({
    data: {
      name: "Nikolas",
      email: "burk@prisma.io",
      posts: {
        create: {
          content: "A practical introduction to Prisma",
        },
      },
    },
  });
  console.log(result);
}
main().catch(e => console.error(e)).finally(async () => await prisma.$disconnect());
```

## Task 11: Write a query that filters for users whose

For this task, you can again reuse the same `findMany` query. Only that this time, you don't want to return *all* `User` records which start with the letter `"A"`. Can you find the right operator condition?

### ▼ Solution

```
import { PrismaClient } from "@prisma/client"
const prisma = new PrismaClient();
async function main() {
  const result = await prisma.user.findMany({
    where: { name: { startsWith: "A" } },
  });
  console.log(result);
}
main().catch((e) => console.error(e)).finally(async () => await prisma.$disconnect());
```

## Task 12: Write a pagination query

Prisma Client provides several ways to paginate over a list of records. From before, you learned how to return only the *third* and *fourth* `User` records.

### ▼ Solution

```
import { PrismaClient } from "@prisma/client"
const prisma = new PrismaClient();
async function main() {
  const result = await prisma.user.findMany({
    skip: 2,
    take: 2,
  });
  console.log(result);
}
main().catch((e) => console.error(e)).finally(async () => await prisma.$disconnect());
```

## Next steps

With these tasks, you only scratched the surface of what's possible with Prisma Client. Feel free to explore more queries and try out some of the other features.
